Contents

1	Begin	1
1.1	Writing a Simple C++ Program	1
1.1.1	Example 1_1_1	1
1.1.2	Compiling and Executing Our Program	1
1.1.3	Exercise	2
1.2	A First Look at Input/Output	2
1.2.1	Standard Input and Output Objects	2
1.2.2	A Program That Uses the IO Library	2
1.2.3	Writing to a Stream	3

1 Begin

1.1 Writing a Simple C++ Program

1.1.1 Example 1_1_1

```
#include<iostream>
using std::cout;
using std::endl;
int main()
{
    cout<<"Hello world"<<endl;
    return 0;
}
```

1.1.2 Compiling and Executing Our Program

1. Comliling

```
#!/bin/bash
cd Code
g++ hello.cpp -o Hello
```

In the next, I just use Automake to compile.

2. Executing ./Hello

1.1.3 Exercise

1. Exercise 1.2 Change the program to return -1. A return value of -1 is often treated as an indicator that the program failed. Recompile and rerun your program to see how your system treats a failure indicator from main.

(a) Answer

```
#include<iostream>

int main()
{
    return -1;
}
```

1.2 A First Look at Input/Output

1.2.1 Standard Input and Output Objects

The library defines four IO objects:

1. `istream:cin`
2. `ostream:cout`
3. `cerr`
4. `clog`

1.2.2 A Program That Uses the IO Library

```
#include<iostream>
int main()
{
    std::cout<<"Enter two numbers : "<<std::endl;
```

```

    int v1=0,v2=0;
    std::cin>>v1>>v2;
    std::cout<<"The sum of "<<v1<<"and "<<v2<<" is "<<v1+v2<<std::endl;
    return 0;
}

```

1.2.3 Writing to a Stream

```
std::cout<<"Enter two number"<<std::endl;
```

std::cout is a object in ostream (extends from istream and ostream), specifically, in library ostream, the operator "<<"
